PROJECT REPORT

ON

"FixServices"

SUBMITTED

TO

KIT'S INSTITUTE OF MANAGEMENT EDUCATION AND RESEARCH (AUTONOMOUS), KOLHAPUR

FOR THE PARTIAL FULFILLMENT OF

MASTER OF COMPUTER APPLICATION

(MCA – I, SEMESTER-II)

BY

Mr. Shreyash R. Kagale

UNDER THE GUIDENCE

OF

Mrs. S.S.Shaha

(B.C.S, MCA)

THROUGH THE

DIRECTOR

KOLHAPUR INSTITUTE OF TECHNOLOGY'S

INSTITUTE OF MANAGEMENT EDUCATION &

RESEARCH (AUTONOMOUS), KOLHAPUR

(2026-2027)

KOLHAPUR INSTITUTE OF TECHNOLOGY'S INSTITUTE OF

MANAGEMENT EDUCATION AND RESEARCH

(AUTONOMOUS)

GOKUL SHIRGAON, KOLHAPUR

MCA DEPARTMENT

CERTIFICATE

This is to certify that the Mini Project report entitled "FixServices" submitted by "Mr. Shreyash Ramesh Kagale" PRN : "2526200053" in partial fulfilment of the Master of Computer Application (M.C.A.) Semester-III course submitted to KIT'S INSTITUTE OF MANAGEMENT EDUCATION & RESEARCH (AUTONOMOUS), KOLHAPUR (Affiliated to Shivaji University, Kolhapur) for the year 2026-27. This is a genuine and Bonafide work prepared under my supervision and guidance.

To the best of knowledge and belief the matter presented in this project report has not been submitted earlier to any university for similar purposes.

Place: Kolhapur

DECLARATION

To.

The H.O.D.

MCA Department.

KIT's IMER(Autonomous), Kolhapur.

Respected Sir.

I undersigned hereby declare that the project entitled “FixServices" is developed by me under the guidance of Mrs. S. S. Shaha and this project work is submitted in partial fulfillment of the award of Master of Computer Application. The information generated in this project work is based on data collected by me.

I have not copied from any project report submitted to KIT"S Institute of Management Education & Research (Autonomous), Kolhapur (Affiliated To Shivaji University, Kolhapur) earlier.

Place:

Kolhapur.

Date:

Mr. Shreyash Ramesh Kagale

ACKNOWLEDGMENT

We are pleased to present our academic project titled “FixServices”.

We express our sincere gratitude to Mrs. S. S. Shaha for his valuable guidance, constant support, and insightful supervision throughout the project. His encouragement and expert advice were instrumental in the successful completion of this work.

We would also like to express our deep gratitude to Dr. D. B. Desai, Head of the Department, MCA, for providing us with the necessary support and academic environment to complete this project.

We extend our thanks to our friends and colleagues for their moral support, encouragement, and helpful suggestions throughout the course of this project. Finally, we acknowledge the contribution of all individuals and sources that helped us directly or indirectly in completing this academic Project.

Thank You

Place: Kolhapur,

Chapter 1:Introduction

1.1 Introduction

In our day-to-day life, we often need services like an electrician, plumber, cleaner, painter or appliance repair person. Many people find these workers through relatives, friends, local shops or phone calls. This works sometimes, but it can take time. A customer may not know which provider is available in their area, what services they offer, or what price they may charge.
FixServices is a web-based project made to make this process easier. It brings local home-service listings together on one website. A customer can select a district, taluka, town or village, and service category to look for suitable services. The system then checks the information stored in its database and displays listings that match the selected area and category. The customer can read the service details and, after signing in if required, submit a booking request.

1.2 Company Profile

(Not Applicable – Academic Project)

1.3 System Requirements

H/W Requirements:

- Processor: Intel Core i3 or equivalent AMD processor.
- RAM: Minimum 4 GB.
- Hard Disk: Minimum 10 GB of free storage space.
- Operating System: Windows 10 or above.
- Monitor: Standard display monitor.
- Keyboard: Standard keyboard for entering data and writing code.
- Mouse: Standard mouse for navigation and interaction.
- Network: Internet connection for downloading software and accessing online resources.

S/W Requirements:

2 Web Server: Apache Server through XAMPP.
3 Programming Language: PHP.
4 Database Management System: MySQL.
5 Web Browser: Google Chrome, Mozilla Firefox, or Microsoft Edge.
6 Code Editor: Visual Studio Code or Notepad++.

7 Frontend Technologies: HTML, CSS, and JavaScript.
8 CSS Framework: Bootstrap 5 for responsive website design.
9 Database Administration Tool: phpMyAdmin for managing the MySQL database.
10 Local Development Environment: XAMPP for running PHP and MySQL on the
, local computer.

1.4 Detailed Description of Technology Used

HTML5: HTML provides the basic structure of the website, including headings, navigation links, forms, buttons and service cards.

CSS3: CSS is used to style the pages. It controls colours, spacing, fonts, alignment and other visual details.

Bootstrap 5: Bootstrap provides ready-made responsive layout classes and components. It helps the website display properly on different screen sizes and makes forms, buttons, cards and navigation easier to design.

JavaScript: JavaScript can support small interactive features, such as the mobile navigation toggle or client-side feedback, where those features are used.

PHP: PHP runs on the server. It processes forms, checks login details, manages sessions, validates submitted information, communicates with the database and handles service and booking operations.

MySQL/MariaDB: The database stores user accounts, categories, service listings, bookings and other records included in the project.
PDO and prepared statements: PHP Data Objects (PDO) allows PHP to connect to the database. Prepared statements help handle user-provided values safely in SQL queries.

XAMPP: XAMPP provides a local development environment with Apache, PHP and MySQL/MariaDB. It allows the project to be tested on a local computer before any online deployment.

Chapter 2 : Proposed System

2.1 Proposed System

The proposed system is a single website where customers can look for local home services and submit booking requests. Instead of searching through many advertisements or calling different people one by one, the customer can select a location and service category and view matching listings.

For example, a person looking for an electrician can select Kolhapur district, Karveer taluka, their town or village, and the Electrical Services category. FixServices checks the saved locality details and category of active service listings and displays the matching results from eligible providers. The exact result depends on the location fields and filtering rules used in the actual database query.

A service listing may show the service title, description, provider name, price and rating if available. After choosing a suitable service, the customer can submit a booking. The provider can respond using the booking features available in the project. Provider approval can help prevent unapproved accounts from displaying public service listings.

Objectives of system

1. To provide one place where people can discover local home services.
2. To allow service discovery by district, taluka, town or village .
3. To display useful service details such as description, provider name and price.

2.2 Feasibility Study

Technical feasibility: The project uses common web technologies such as PHP, MySQL/MariaDB, HTML, CSS, Bootstrap and XAMPP. These are suitable for developing and testing a small database-driven application.

Economic feasibility:
Most development tools used for this mini-project are free or open source. If the project is later made available online, expenses may include hosting, a domain name or any paid external services.

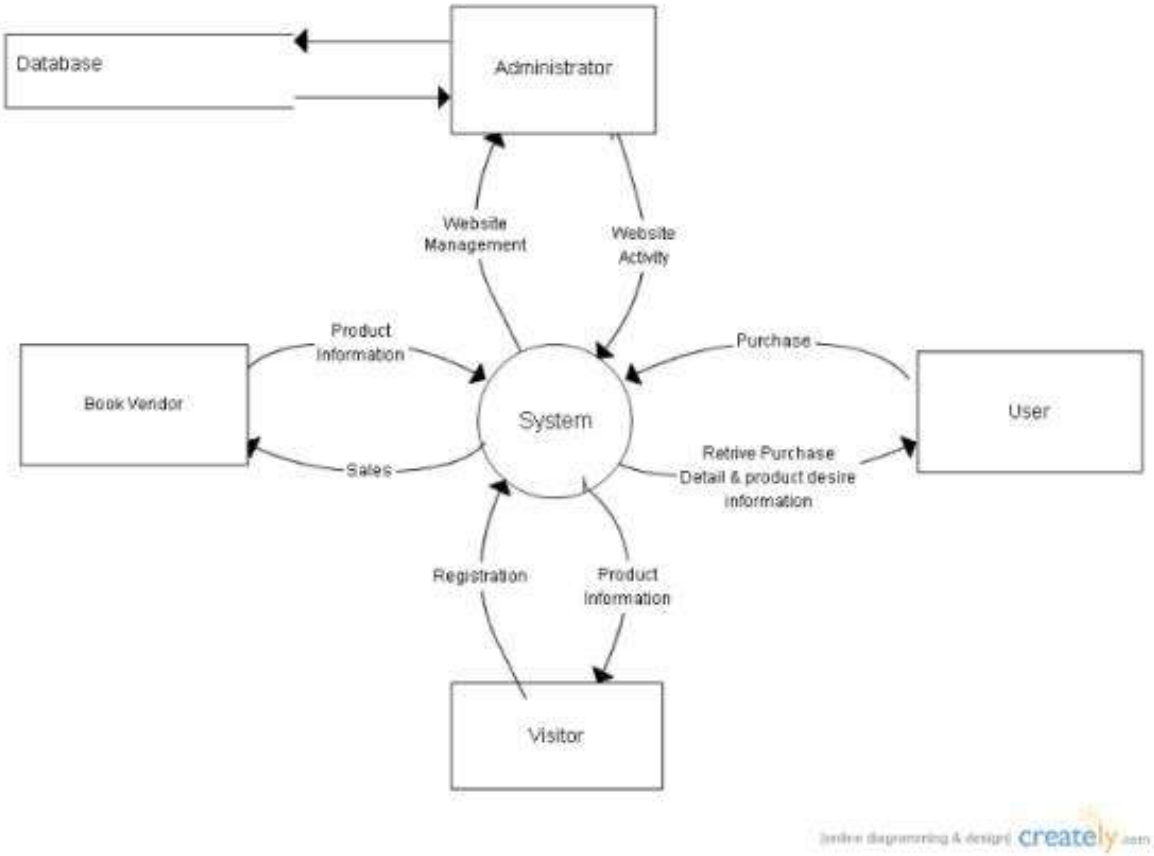

Operational feasibility:
The main customer flow is easy to understand: choose the location, select the category, view services and submit a booking. Clear labels and helpful messages can make the process easier.

Schedule feasibility:
The basic version can be completed as a college mini-project by focusing on registration, login, local service discovery, service listings and booking management. Extra features can be added later.

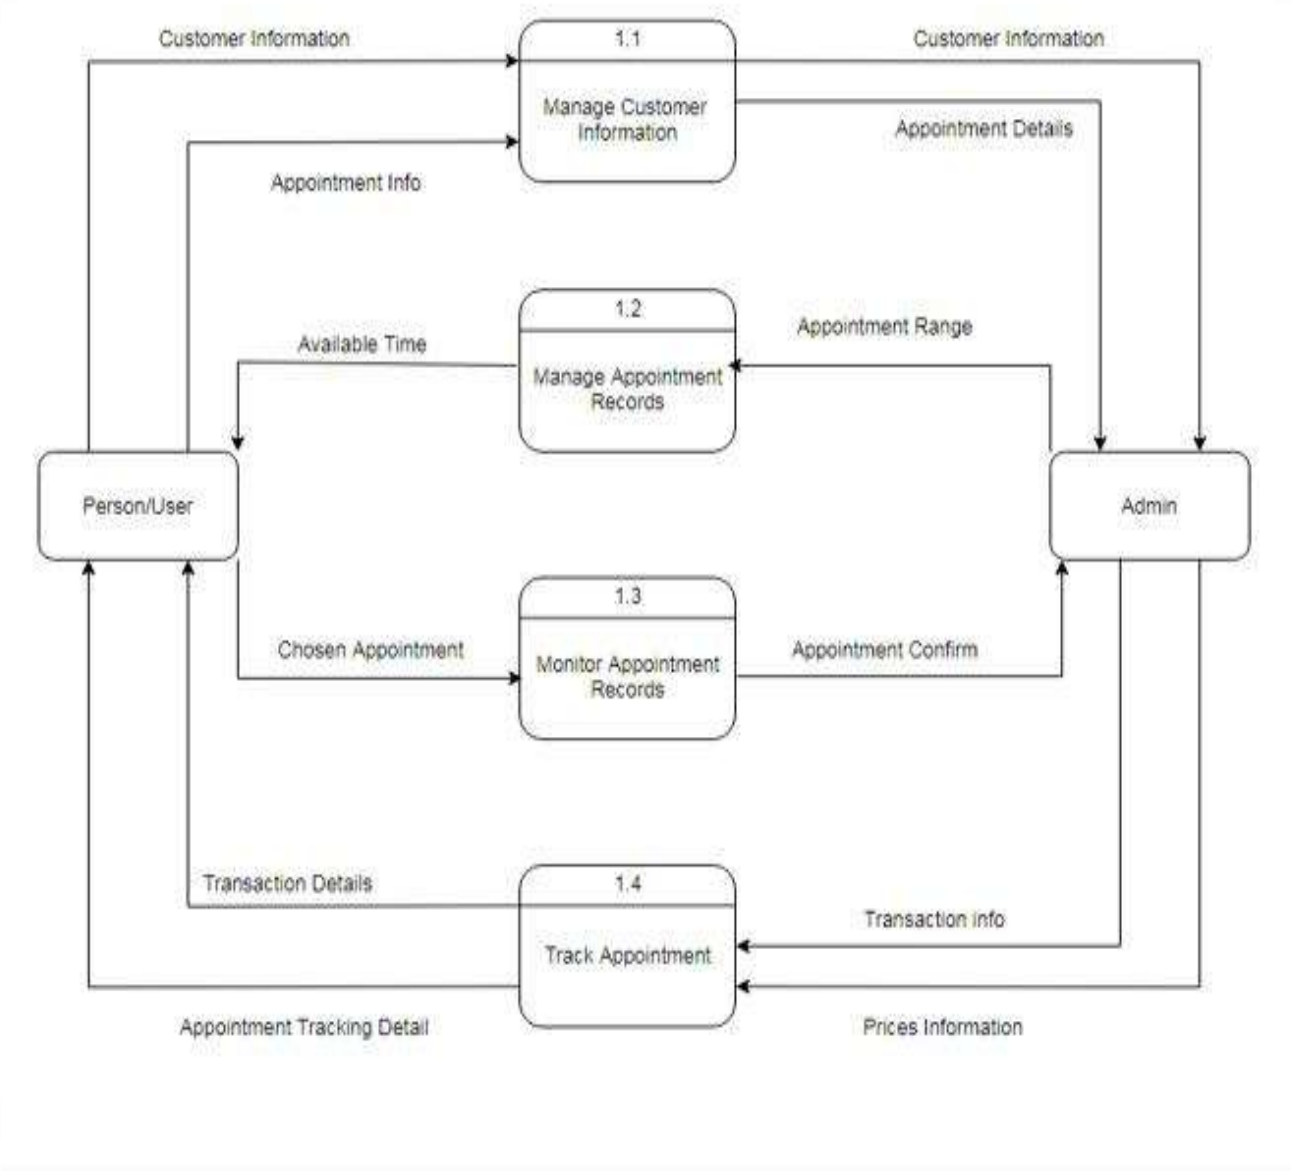

Security feasibility:
The project should use password hashing, server-side validation, prepared statements, role-based access, CSRF protection where needed, safe output escaping and secure session settings. These points should be checked in the final code.

Chapter 5 :User Manual

5.1 User Manual

Starting the project on a local computer

Install XAMPP and start the Apache and MySQL services.

Copy the FixServices project folder into the XAMPP htdocs folder.

Open phpMyAdmin and create the database named in config.php or in the supplied SQL file.

Import the database schema that matches this version of the project. Avoid importing an older or different schema without checking the table and column names.

Update config.php with the correct database host, name, username and password.

Open a browser and visit a local URL such as http://localhost/FixServices/ (change the folder name if yours is different).

Test the website using separate customer, provider and administrator test accounts.

Steps for a customer

Open the website and select Services.

Choose the district, taluka, town or village, and service category.

Review the matching service listings and open a suitable one.

Sign in or create an account if booking requires authentication.

Enter the booking details requested by the form and submit the request.

Open My Bookings, if available, to check the booking status.

Steps for a service provider

Register using the Service Provider account type.

Enter correct profile and locality details.

Wait for administrator approval if the project requires it.

After approval, add clear service descriptions and correct prices using the provider dashboard.

Review booking requests and update them using the actions available in the application.

Steps for an administrator

Sign in using the administrator account created for the project.

Review provider applications and approve or reject them if those controls are available.

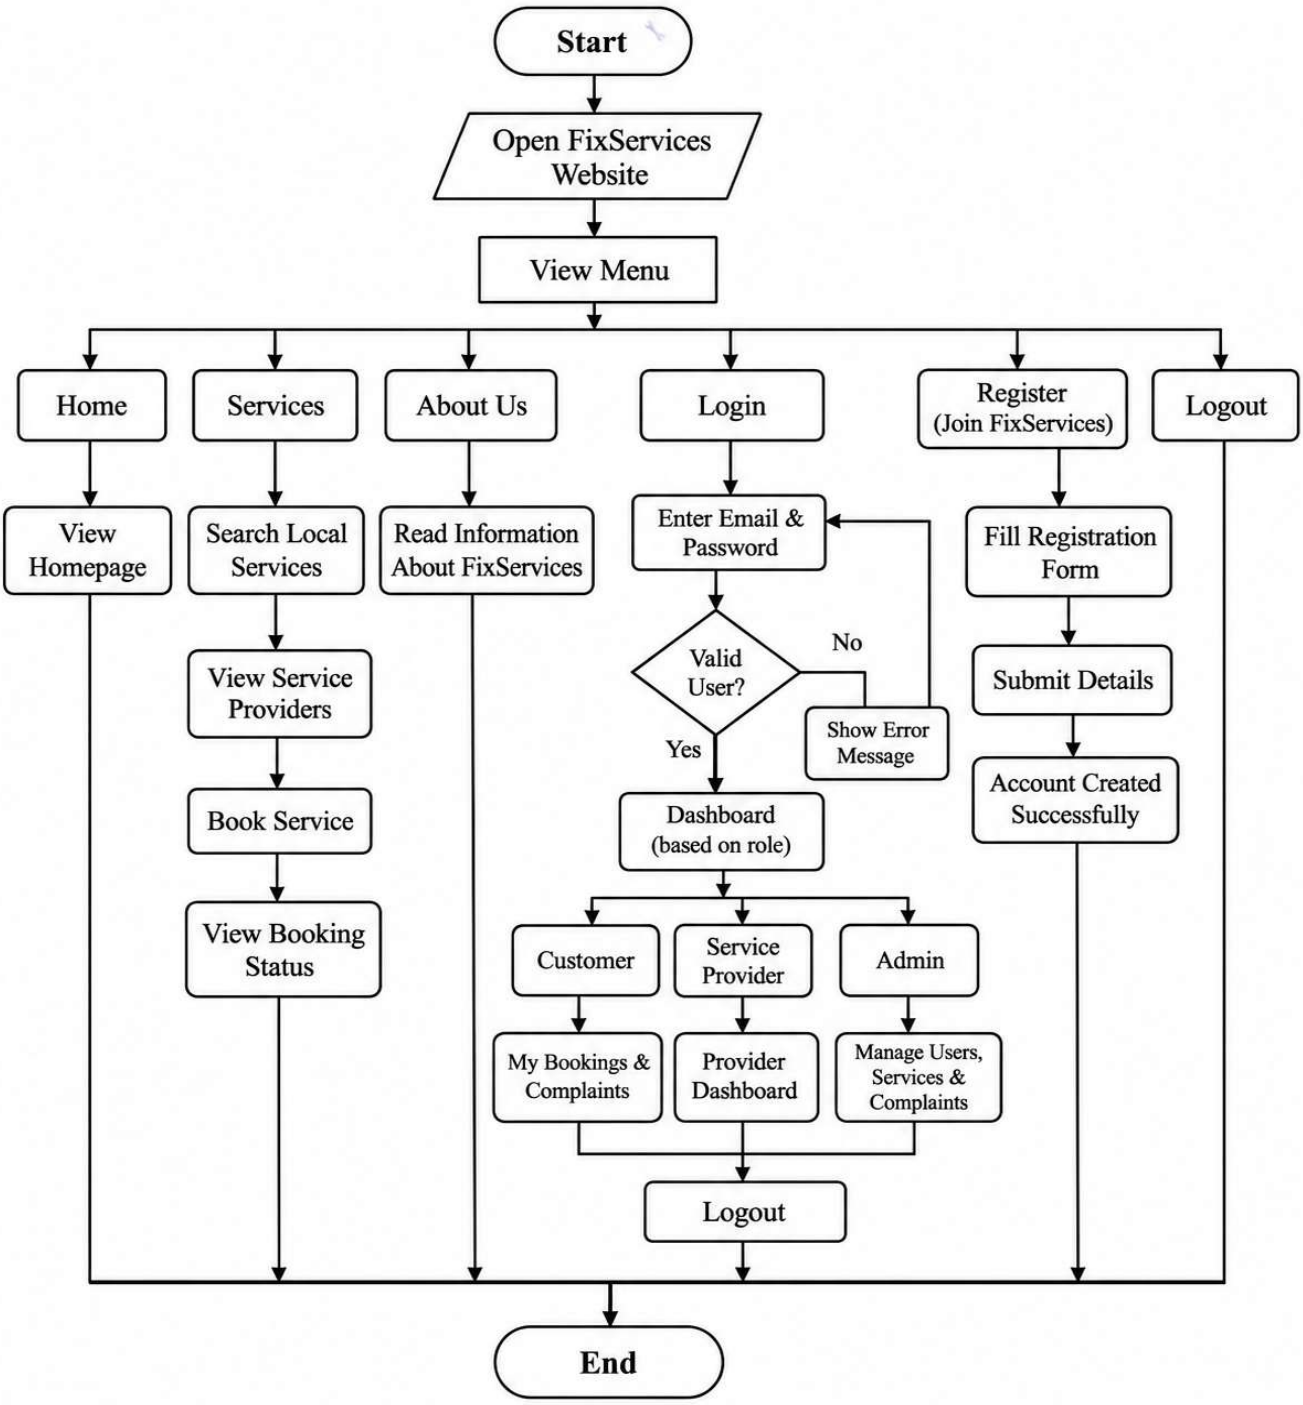

Manage categories, listings and other records supported by the admin page.

Keep administrator login details private, especially if the project is hosted online.

Menu Explanation

1. Home: This menu option takes the user to the main page of the FixServices website, where they can get basic information about the project and its services.
2. Services: It allows customers to view available home services and search for local service providers based on service category, district, taluka, and town or village.
3. About Us: This option provides information about FixServices, its purpose, and the services offered through the platform.
4. Login: This option allows existing customers, service providers, and administrators to log in using their registered email and password.
5. Register / Join FixServices: New users can create an account as a customer or service provider by entering their required details.
6. My Bookings: This option allows customers to view their booked services and check the current booking status.
7. Complaints: Customers can submit complaints regarding services or providers and view information about their complaints.
8. Provider Dashboard: This option allows service providers to manage their services, view customer booking requests, and update booking status.
9. Admin: This option is available only to the administrator. The admin can manage users, approve service providers, manage categories, monitor bookings, and handle complaints.
10. Logout: This option allows logged-in users to securely exit their accounts.
Note: Some menu options are displayed according to the user's role. For example, customers can access My Bookings and Complaints, while service providers can access the Provider Dashboard.

1.1 Flow Chart
For Reader:

Chapter 6: Limitations and Suggestions

6.1 Limitations

1. The quality of local search depends on providers entering correct district, taluka and town/village information.
2. Matching locality names does not calculate the physical distance or travel time to a provider unless coordinates and distance calculations are added.
3. The number of results depends on how many providers have registered and published services.
4. Provider approval, booking updates, reviews, complaints and notifications can be described as working features only if they are implemented and tested.
5. A local XAMPP setup is mainly for development and demonstration; a public website needs suitable hosting and stronger production security.
6. Bootstrap or other CDN-hosted files may need an internet connection.
7. A listing alone cannot guarantee the quality, availability or behaviour of a service provider.

6.2 Suggestions

1. Add map coordinates and distance-based sorting if customers need to find the physically nearest provider.
2. Use dependent dropdowns so the town/village choices update according to the selected district and taluka.
3. Improve provider verification and provide a way to report incorrect listings.
4. Add booking notifications if the hosting environment supports them.
5. Improve booking history, review moderation and complaint tracking where useful.
6. Add pagination and database indexes if the number of listings grows.
7. Improve mobile usability, accessibility and form validation.
8. Before public deployment, configure HTTPS, secure sessions, rate limiting, regular backups and production settings.

Chapter 7: Conclusion

7.1 Conclusion

FixServices is a useful mini-project idea because it addresses a common problem: finding a suitable person for home-related work in one's own area. By arranging service listings according to category and saved locality details, the website gives customers a more organised way to discover local services without making a PIN code compulsory. The booking process also helps keep customer requests and their status in one place.

The project brings together a website interface, PHP processing and a relational database. Its success depends on correct provider information, clear pages, reliable booking records and proper security. In the future, features such as map-based distance sorting, stronger provider verification and booking notifications can make the system more useful.
